

# RUMAD

Rutgers Mobile App Development

# Bonus Workshop 1: Regex, Overview

**For this bonus workshop, we'll be covering:**

- Fundamentals of Regular Expressions
- Its applications
- Implementations in JavaScript

# What are Regular Expressions (Regex)?

## Simple definition:

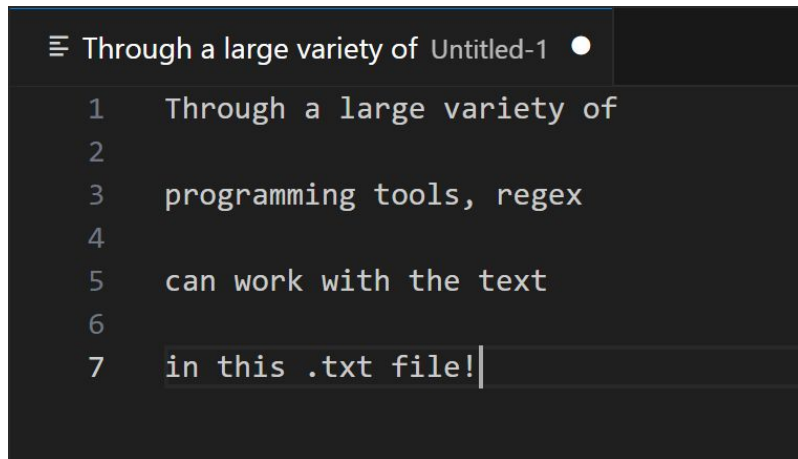

- Sequences of characters used to find and manipulate strings based on patterns

Example of regex, Text Platform

# Why do we need RegEx?

- Concise and efficient way to work with text
  - Text processing is extensive in most computational fields
  - Small syntax, large impact
  - Supported by many programming tools

A screenshot of a code editor window titled 'Untitled-1'. The editor has a dark background and shows a text file with the following content:

```
1 Through a large variety of
2
3 programming tools, regex
4
5 can work with the text
6
7 in this .txt file!
```

The text 'in this .txt file!' on line 7 is highlighted with a light blue selection. The cursor is positioned at the end of this line.

Example .txt file

# Applications of RegEx

- Text searching/replacing within files and strings
- Text input validation
  - Ex. emails, passwords, phone numbers
- Data extraction from text
  - Ex. web scraping

Web scraping flow chart, *CrawlNow*

The background is a solid dark red color. Overlaid on this are faint, stylized illustrations of a smartphone. The phone is tilted diagonally. On its screen, there is a satellite dish icon in the upper half and a lightbulb icon in the lower half. The text 'RegEx Symbols' is centered over the phone's screen area.

# RegEx Symbols

# Symbols

These symbols are paired together to extract/match structured pieces of text.

Symbol	Description	Symbol	Description
<b>^</b>	Start of line +	<b>?</b>	0 or 1 +
<b>\A</b>	Start of string +	<b>{3}</b>	Exactly 3 +
<b>\$</b>	End of line +	<b>{3,}</b>	3 or more +
<b>\Z</b>	End of string +	<b>{3,5}</b>	3, 4 or 5 +
<b>\b</b>	Word boundary +	<b>\</b>	Escape Character +
<b>\B</b>	Not word boundary +	<b>\n</b>	New line +
<b>&lt;</b>	Start of word	<b>\r</b>	Carriage return +
<b>&gt;</b>	End of word	<b>\t</b>	Tab +
<b>\s</b>	White space	<b>.</b>	Any character except new line (\n) +
<b>\S</b>	Not white space	<b>(a b)</b>	a or b +
<b>\d</b>	Digit	<b>[abc]</b>	Range (a or b or c) +
<b>\D</b>	Not digit	<b>[^abc]</b>	Not a or b or c +
<b>\w</b>	Word	<b>[0-7]</b>	Digit between 0 and 7 +
<b>\W</b>	Not word	<b>[a-q]</b>	Letter between a and q +
<b>*</b>	0 or more +	<b>[A-Q]</b>	Upper case letter + between A and Q +
<b>+</b>	1 or more +		

# Quantity

- $x\{p\}$  matches exactly  $p$  repetitions of  $x$
- $x\{p, \}$  matches  $p$  or more repetitions of  $x$
- $x\{p, q\}$  matches  $p$  to  $q$  repetitions of  $x$  (Inclusive)
- $x^*$  matches  $0$  or more repetitions of  $x$
- $x^+$  matches  $1$  or more repetitions of  $x$

## Quick Examples

$w\{3\}$  matches **www**

$w\{3, 4\}$  matches **www, wwww**

$w^*$  matches **"", w, wwwwww** (any number of **ws**)

$w^+$  matches **w, wwwwww**, any number of  **$w \geq 1$**

# Grouped Matching

- (cat|dog) matches **cat** or **dog** vs.  
[cat|dog] matches 'c', 'a', 't', '|', 'd', 'o', 'g'
- [0-9] matches any digit 0-9 **once**
- [a-zA-Z0-9] matches any alphanumeric
- [^0-9] matches any non-digit character, “^” = **not**

## Quick Examples

(cat|dog){2} matches:  
**catcat, dogdog, catdog, dogcat**

[a-zA-Z0-9]\* matches:  
**Cs112** or any word that has  
**alphanumerics** as well as “”

[^a-zA-Z]+ matches:  
1 or more combination of digits or  
special characters like **1&234\$@**  
- Doesn't match ABC123

# Shortcuts

- Easy encodings for common matching patterns:
  - alphanumeric:[a-zA-Z0-9]
  - digit [0-9].

## For your reference

- **Extra Symbols:**
  - escape character: \
  - . matches any character so .\* would match any sequence of characters

Shortcut	Equivalent to
<code>\d</code> <code>\d\d</code> or <code>\d{2}</code>	<code>[0-9]</code> <code>[0-9]{2}</code>
<code>\D</code>	<code>[^0-9]</code> = “NOT” digit
<code>\w</code> <code>\W</code>	<code>[a-zA-Z0-9_]</code>  <code>[^a-zA-Z0-9_]</code> = “NOT” word
<code>\s</code>  <code>\S</code>	Captures space characters like “ ”, tabs, new-lines, carriage returns, etc. <code>[\t\n\r\f\v]</code>  <code>[^ \t\n\r\f\v]</code> = “NOT” space

# Examples

# Matching Rutgers emails

hpm27@scarletmail.rutgers.edu

What is **constant** in this format?

- The @ symbol
- “.rutgers.edu”

What **varies**?

- The netID, it could be any combination of letters and numbers
- “scarletmail” or could be a different domain such as “rwjms”, “cs”, etc.

# Matching Rutgers emails

hpm27@scarletmail.rutgers.edu

So far we have: \_\_\_\_@\_\_\_\_\_.rutgers.edu

We can match a combination of letters & numbers using `[a-z0-9]+`

- Interpret this as a or b or c... or 0 or 1 or 2...
- The + indicates that we're trying to match **1 or more**

**This gives us:** `[a-z0-9]+@[a-z]+\.`rutgers.edu

# Gene Matching with RegEx

- A genome sequence consists of the letters **A, C, T, G**.
- A potential gene is represented by a string of the form:
  - (prefix) **gene** (postfix)
  - **Prefix** = ATG
  - **Postfix** = TAG/TAA/TGA
  - **Gene** = stuff in between

**We want to capture what's in between!**

# Gene Matching with Regex

So far we have:

ATG\_\_\_\_(TAG|TAA|TGA)

What's wrong with this expression?

ATG.\*(TAG|TAA|TGA)

- This will match the entire expression including prefix and postfix, what if we want what's in between without extra preprocessing?
- How do we do this? → **Capture Group**

- **Prefix** = ATG
- **Postfix** = TAG/TAA/TGA
- **Gene** = stuff in between

# Gene Matching with Regex

- **Prefix** = ATG
- **Postfix** = TAG/TAA/TGA
- **Gene** = stuff in between

To capture what's between the prefix and postfix, we need a **capture group**!

- Surround parts of a pattern string in parentheses to indicate that we want to specifically capture that information

**Final Expression:**

**ATG**(.\*)(TAG|TAA|TGA)

```
const sequence =  
"AGTATGCATTAGCAT"  
  
const regex =  
/ATG(.*)(TAG|TAA|TGA)/;  
  
const match =  
sequence.match(regex);  
  
//Out:  
// [ATGCATTAG, CAT, TAG]
```

# Implementing RegEx in Code

# Match a Palindrome!

Write a **regular expression** that matches strings which contain **exactly five non-whitespace characters** forming a **5-character palindrome**, while **ignoring any amount of whitespace** (spaces, tabs, newlines) between those characters and at the ends.

Examples that should match:

- `a1b1a`
- `a 1b 1a`
- `#a? a#` (with spaces anywhere)

# Match a Palindrome!

Write a **regular expression** that matches strings which contain **exactly five non-whitespace characters** forming a **5-character palindrome**, while **ignoring any amount of whitespace** (spaces, tabs, newlines) between those characters and at the ends.

Examples that should match:

- a1b1a
- a 1b 1a
- #a? a# (with spaces anywhere)

```
const isPal5 = /^\\s*(\\S)\\s*(\\S)\\s*(\\S)\\s*\\2\\s*\\1\\s*$;/;  
const is5CharPalindromeIgnoringWS = s => isPal5.test(s);
```

# Practice

Break into groups of  
3-4 and try the next  
few problems!

# Question #1

- What does /go+gle/ match?

a) "gogle"

b) "google"

c) "gooogle"

d) All of the above

# Question #2

- Identify all web URL's in the form:

`https://www.somesite.[com/io/ai]`

-

# Question #3

## Side Note:

\b = boundary tag  
^...\$ are anchor tags

- **Verify all valid dates in the format DD/MM/YYYY.**  
Ex: 05/10/25

# Questions?

Please fill out the feedback form when you have a chance!

# Next Bonus Workshop...

## Postman and OpenAPI

- Friday 10/24/2025, 3:30 PM–4:30 PM
- Using backend tools, like Postman, to test your APIs
- Getting familiar with OpenAPI standard

# Attendance

Please let us know where we can improve the  
format of the lessons!
