

Bonus Workshop 1: Regex, Overview

For this bonus workshop, we'll be covering:

- Fundamentals of Regular Expressions
- Its applications
- Implementations in JavaScript

What are Regular Expressions (RegEx)?

Simple definition:

 Sequences of characters used to find and manipulate strings based on patterns

Example of regex, Text Platform

Why do we need RegEx?

- Concise and efficient way to work with text
 - Text processing is extensive in most computational fields
 - o Small syntax, large impact
 - Supported by many programming tools

Example .txt file

Applications of RegEx

- Text searching/replacing within files and strings
- Text input validation
 - Ex. emails, passwords, phone numbers
- Data extraction front text
 - Ex. web scraping

Web scraping flow chart, CrawlNow

RegEx Symbols

Symbols

These symbols are paired together to extract/match structured pieces of text.

| Symbol | Description | Symbol | Description | |
|--------------|---------------------|--------|---------------------------------------|--|
| ٨ | Start of line + | ? | 0 or 1 + | |
| \A | Start of string + | {3} | Exactly 3 + | |
| \$ | End of line + | {3,} | 3 or more + | |
| \z | End of string + | {3,5} | 3, 4 or 5 + | |
| \b | Word boundary + | 1 | Escape Character + | |
| \B | Not word boundary + | \n | New line + | |
| \< | Start of word | \r | Carriage return + | |
| \> | End of word | \t | Tab + | |
| \s | White space | | Any character except new line (\n) + | |
| \ S | Not white space | (a b) | a or b + | |
| \d | Digit | [abc] | Range (a or b or c) + | |
| \D | Not digit | [^abc] | Not a or b or c + | |
| \w | Word | [0-7] | Digit between 0 and 7 + | |
| \w | Not word | [a-q] | Letter between a and q + | |
| * | 0 or more + | [A-Q] | Upper case letter + between A and Q + | |
| + | 1 or more + | | | |

Quantity

- x{p} matches exactly p repetitions of x
- x{p,} matches p or more repetitions of x
- x{p,q} matches p to q repetitions of x (Inclusive)
- x* matches 0 or more repetitions of x
- x+ matches 1 or more repetitions of x

Quick Examples

w{3} matches www

w{3,4} matches www, wwww

w* matches "", w, wwwwww, any number of ws

w+ matches w, wwwwww, any number of w >= 1

Grouped Matching

- (cat|dog) matches cat or dog vs.
 [cat|dog] matches 'c', 'a', 't', '|', 'd', 'o', 'g'
- [0-9] matches any digit 0-9 once
- [a-zA-Z0-9] matches any alphanumeric
- [^0-9] matches any non-digit character, "^" = not

Quick Examples

(cat|dog){2} matches:
catcat, dogdog, catdog, dogcat

[a-zA-Z0-9]* matches: **Cs112** or any word that has **alphanumerics** as well as ""

[^a-zA-Z]+ matches: 1 or more combination of digits or special characters like **1&234\$@**

Doesn't match ABC123

Shortcuts

- Easy encodings for common matching patterns:
 - o alphanumeric:[a-zA-Z0-9]
 - o digit [0-9].

For your reference

- Extra Symbols:
 - escape character: \
 - . matches any character so
 .* would match any
 sequence of characters

| Shortcut | Equivalent to | |
|---------------------|---|--|
| \d \d\d or \d{2} | [0-9] [0-9]{2} | |
| \D | [^0-9] = "NOT" digit | |
| \w | [a-zA-Z0-9_] | |
| \W | [^a-zA-Z0-9_] = "NOT" word | |
| \s | Captures space characters like " ", tabs, new-lines, carriage returns, etc. [\t\n\r\f\v] | |
| \S | [^ \t\n\r\f\v] = "NOT" space | |

Matching Rutgers emails

hpm27@scarletmail.rutgers.edu

What is constant in this format?

- The @ symbol
- ".rutgers.edu"

What varies?

- The netID, it could be any combination of letters and numbers
- "scarletmail" or could be a different domain such as "rwjms", "cs", etc.

Matching Rutgers emails

hpm27@scarletmail.rutgers.edu

So far we have: ____@___\.rutgers\.edu

We can match a combination of letters & numbers using [a-z0-9]+

- Interpret this as a or b or c... or 0 or 1 or 2...
- The + indicates that we're trying to match 1 or more

This gives us: [a-z0-9]+@[a-z]+\.rutgers\.edu

Gene Matching with Regex

- A genome sequence consists of the letters A, C, T, G.
- A potential gene is represented by a string of the form:
 - (prefix) gene (postfix)
 - Prefix = ATG
 - Postfix = TAG/TAA/TGA
 - Gene = stuff in between

We want to capture what's in between!

Gene Matching with Regex

So far we have: ATG____(TAG|TAA|TGA)

What's wrong with this expression?

ATG.*(TAG|TAA|TGA)

- This will match the entire expression including prefix and postfix, what if we want what's in between without extra preprocessing?
- How do we do this? → Capture Group

- Prefix = ATG
- Postfix = TAG/TAA/TGA
- Gene = stuff in between

Gene Matching with Regex

- To capture what's between the prefix and postfix, we need a **capture group!**
 - Surround parts of a pattern string in parentheses to indicate that we want to specifically capture that information

Final Expression:

ATG(.*)(TAG|TAA|TGA)

- Prefix = ATG
- Postfix = TAG/TAA/TGA
- Gene = stuff in between

```
const sequence =
"ATGCATTAG"
const regex =
/ATG(.*)(TAG|TAA|TGA)/;
const match =
sequence.match(regex);
//Out:
  [ATGCATTAG, CAT, TAG]
```

Implementing RegEx in Code

Code to accomplish examples from before

Practice

Break into groups of 3-4 and try the next few problems!

Question #1

- What does /go+gle/ match?
 - a) "gogle"
 - **b)** "google"
 - c) "gooogle"
 - d) All of the above

Question #2

Identify all web URL's in the form:

https://www.somesite.[com/io/ai]

•

Question #3

• Verify all valid dates in the format DD/MM/YYYY.

Ex: 05/10/25

•

Questions?

Please fill out the feedback form when you have a chance!

Next Bonus Workshop...

Postman and OpenAPI

- Friday 10/24/2025, 3:30 PM-4:30 PM
- Using backend tools, like Postman, to test your APIs
- Getting familiar with OpenAPI standard
